LexChain Advanced Seminar

Sean Agustine Esparagoza, Marvin Pescos, and Badygin Sinco

Repository: LexChain on GitHub
Task branch: feature/advanced-seminar-agent-skills

Branch and base

Repository guidance names main as the released source and dev as the integration branch. We created feature/advanced-seminar-agent-skills from origin/main at 40923b1 and pushed it to GitHub.

Agent guidance

We reviewed README.md, docs/ARCHITECTURE.md, and the root AGENTS.md before editing. We added a Project skills section linking to the two LexChain skills and the Vercel skill. The existing frontend/backend, API, security, and workflow guidance remains.

LexChain-specific skills

- lexchain-document-workflows covers the document library, upload, review, lifecycle, verification, activity, and access flows. Frontend role checks guide the UI; the backend controls authorization.
- lexchain-api-integration covers browser requests through the shared client and same-origin route handlers, plus server requests through server-only backend helpers. It preserves methods, payloads, headers, response and error contracts, cookies, and React Query behavior. Generated OpenAPI types must not be hand-edited.

Provider skill

We installed Vercel React Best Practices from Vercel Labs agent-skills. Its metadata lists Vercel as author and MIT as the license. The README credits @shuding for the original guidance.

Source: vercel-react-best-practices/SKILL.md

Provider repository and license reference: vercel-labs/agent-skills README

Install command: pnpm dlx skills add vercel-labs/agent-skills --skill vercel-react-best-practices --agent codex --copy --yes. Files are in .agents/skills/vercel-react-best-practices/; skills-lock.json records the source and path.

Verification

All three skills passed quick_validate.py. We checked the Markdown links, skill files, screenshots, report formatting, and commit scope. The whitespace check found trailing spaces in unchanged provider files. We did not run application tests or a build because no runtime code changed.

These are direct GitHub screenshots from the task branch. They show the branch, skills folder, AGENTS.md links, and all three skills. The images are unedited and show no credentials or tokens.
